

Know your supply chain, from tier 1 to tier n.

DEISO Moto Pro collects primary data from your suppliers, checks every answer and shows how far you can trust the total, on your own computers.

Scope 3 and product carbon footprints

Supplier ESG and due diligence

CBAM and EUDR evidence

Arabic, Japanese and 5 more languages

Your largest emissions sit with suppliers you cannot see.

For energy and industrial companies, the footprint of what you buy is decided upstream: in refineries, foundries, fabricators and logistics fleets several tiers away. Reporting frameworks now ask for supplier-specific data, and for proof of where each number came from.

What slows teams down today

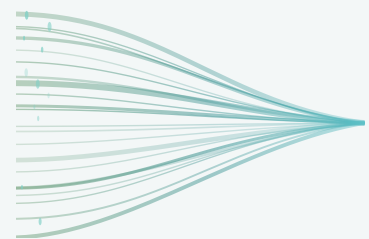

- ✗ **Averages instead of your suppliers**
Secondary factors describe an industry, not the companies you actually buy from, and they reward nobody for improving.
- ✗ **Requests that go unanswered**
Spreadsheets by email, mixed units, no reminders and no view of who has replied, tier after tier.
- ✗ **Numbers nobody can defend**
No source, no data quality grade and no audit trail when an assurance provider asks how a figure was built.

What changes with DEISO Moto Pro

- ✓ **Supplier-specific primary data**
Standards-based questionnaires, written by DEISO, that suppliers can answer in their own language.
- ✓ **A campaign that runs itself**
Personal Moto Link web forms, automatic reminders and replies read back on their own, down to tier n.
- ✓ **A total you can stand behind**
Quality grades, plausibility checks, reviewer approval, an audit trail, and the likely range of your total.

Every figure comes from your suppliers. No emission factors or databases are hidden inside, so every number has an owner and a source.

How DEISO Moto Pro is built

From the first questionnaire to answers you can use.

1

Build

Pick one of 15 templates, from LCA and product carbon footprints to Scope 3, ESG, CBAM and EUDR. The right questions are set for you.

2

Send

Add suppliers one by one or import your list. Each receives a Moto Link web form, an Excel file or a fillable PDF, with reminders after 7, 14, 21 and 28 days.

3

Check

Answers are read back and filed under the right supplier, checked for plausibility and units, graded A to D and approved by a reviewer.

4

Use

Coverage, the Sankey diagram, risk, sensitivity and Monte Carlo, reports and a hand-off file for your study or DEISO tools.

Moto Link

Suppliers answer in the browser. Answers come straight back to you.

Each supplier receives a personal link: no login, no software, in their own language. Drafts save as they go. Finished answers are encrypted end to end, return to your DEISO Moto Pro and are deleted from the server once collected.

1 You send a personal link, greeted by name

2 The supplier fills the web form, in their language

3 Answers return encrypted end to end

4 Filed under the right supplier and tier

Overdue suppliers

Send a reminder from here

Supplier	Waiting	
Anode Materials (fictional)	21 days	No email
Alumina Logistics (fictional)	21 days	No email
Bauxite Freight (fictional)	21 days	No email
Heavy Logistics (fictional)	21 days	No email

Campaign dashboard: response rate, coverage over time and overdue suppliers. Demo data shown.

See every tier on one Sankey diagram.

Suppliers name their own suppliers, and DEISO Moto Pro reaches the next tier for you. Your chain appears on one diagram to any depth, with each supplier's share and data status.

Tier 1 to tier n

Cascade requests down the chain and follow each branch, from the fabricator to the mine and the fleets in between.

Risk view

Colour the same diagram by indicative country and sector risk, and send due diligence questions where it matters.

- Human rights
- Deforestation
- Corruption
- Environment

Coverage you can report

See the share of spend covered by supplier data, and how much of it is measured or calculated rather than estimated.

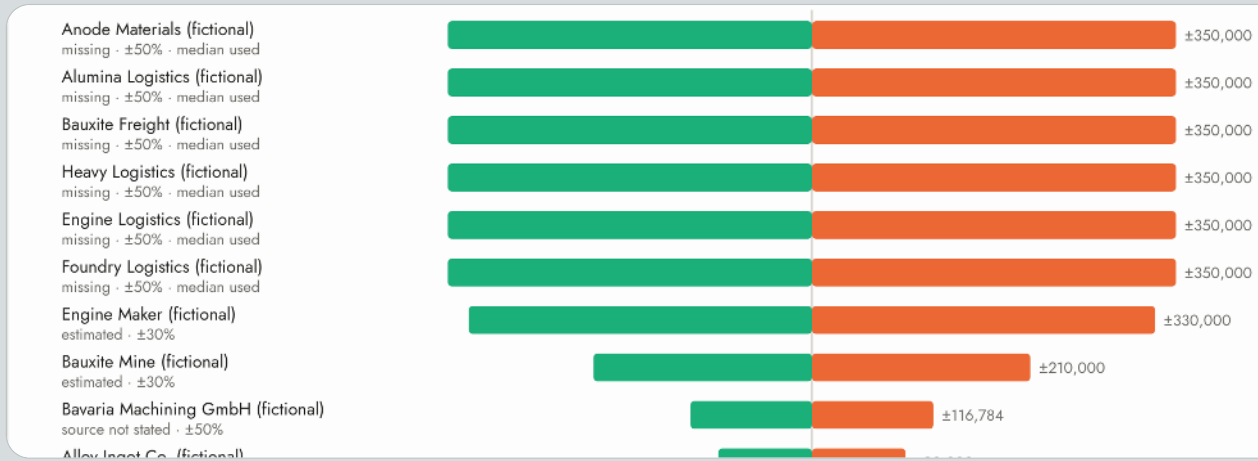

Progress by tier, at a glance

Every tier shows how many suppliers have answered and how good their data is, so procurement and sustainability teams work from the same picture.

Defend every number before anyone asks.

DEISO Moto Pro turns data quality into decisions: which supplier to chase first, how sure your total is, and the chance of exceeding your target.

Sensitivity analysis ranks which supplier's figure moves the total most. Demo data shown.

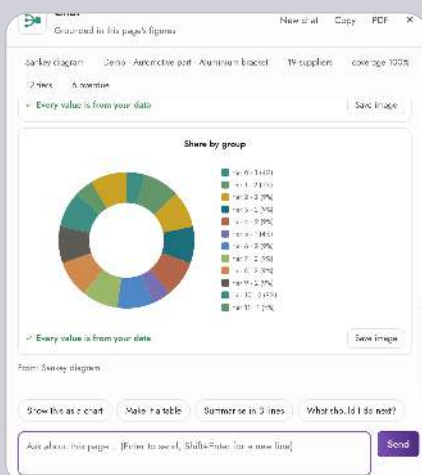

Monte Carlo simulation of the likely total against the target. Demo data shown.

Better data, before you ask for it

Pick a supplier and see how much the range of your total narrows if they send measured data. Then send the request in one click.

Assurance-ready

Quality grades A to D, plausibility checks, reviewer approval and an audit trail with a fingerprint of every imported file.

Chat with results

Ask about any page. Get answers with tables and charts.

Every figure in an answer is checked against your data, and anything not found is marked before you report it. It runs on your own OpenAI key, and supplier contact details are never sent.

Your data stays with you.

On your computers

Kits, suppliers and answers are stored locally or in the cloud folder you choose. Nothing leaves except the licence check.

Encrypted end to end

Moto Link answers can only be read by your installation and are deleted from the server once collected.

Seven languages

Questionnaires and forms in English, Arabic (right to left), Japanese, Chinese, German, Spanish and French.

Mapped to standards

Questions written by DEISO and mapped to the frameworks your reporting follows.

No per-supplier fees

Licensed per computer, from one analyst to an Enterprise Site, however many suppliers you invite.

Support and training

A guided tour, Help Center and user manual, diagnostics for IT, and Moto Training for your team.
